Executive Summary

The transition to adulthood is a critical stage of human development during which young people leave childhood behind and take on new roles and responsibilities. It is a period of social, psychological, economic, and biological transitions, and for many young people it involves demanding emotional challenges and important choices. To a large degree, the nature and quality of young people's future lives depend on how successfully they negotiate through this critical period. Yet in many developing countries, it is a stage of life that has only recently begun to receive focused attention.

The challenges for young people making the transition to adulthood are greater today than ever before. Globalization, with its power to reach across national boundaries and into the smallest communities, carries with it the transformative power of new markets and new technology. At the same time, globalization brings with it new ideas and lifestyles that can conflict with traditional norms and values. And while the economic benefits are potentially enormous, the actual course of globalization has not been without its critics who charge that, to date, the gains have been very unevenly distributed, generating a new set of problems associated with rising inequality and social polarization. Regardless of how the globalization debate is resolved, it is clear that as broad global forces transform the world in which the next generation will live and work, the choices that today's young people make or others make on their behalf will facilitate or constrain their success as adults. Traditional expectations regarding future employment prospects and life experiences are no longer valid.

Concerns about how global forces are altering the passage into adult-

hood are all the more urgent because of the changing demographic profile of many developing countries. The acceleration of these global changes has coincided with unprecedented growth in the size of the population of young people in developing countries. By 2005, the total number of 10-24-year-olds is estimated to have reached 1.5 billion, constituting nearly 30 percent of the population of these regions and 86 percent of all young people in the world. And each subsequent cohort of young people in the developing world is projected to continue to increase until 2035, as rapid growth in Africa and parts of Asia counteracts some slow declines in absolute numbers elsewhere in Asia and in Latin America and the Caribbean.

Recognizing the need to learn more about this crucial period of life, the National Research Council convened a panel of experts to examine how the transition to adulthood is changing in developing countries, and what the implications of these changes might be for those responsible for designing youth policies and programs, in particular, those affecting adolescent reproductive health.

According to the panel's findings, important transformations in young peoples' lives are under way. In much of the developing world, adolescence is a stage of life that is gaining in significance. In the past, young men and women tended to move directly from childhood to adult roles. But today the interval between childhood and the assumption of adult roles is lengthening. Compared to the situation 20 years ago, young people are

- entering adolescence earlier and healthier,
- more likely to spend their adolescence in school,
- more likely to postpone entry into the labor force, and
- more likely to delay marriage and childbearing.

As a result of these changes, on average, young people in the developing world now have more time and opportunities than ever before to acquire the information and skills necessary to become effective participants in decisions about their own lives and futures.

These broad statements capture only the average tendencies for young people in developing countries, which tend to be statistically dominated by trends in developing Asia, where 70 percent of young people in developing countries live, 42 percent in India and China alone. Differential rates of change have led, in some cases, to growing differences among adolescents within and across countries, as some young people experience progress while others are left behind. Over the past 20 years, economic growth rates in Latin America and the Caribbean and in sub-Saharan Africa have diverged negatively from economic growth rates in developed countries, while growth rates in East and South Asia, where the majority of young people live, have converged toward economic growth rates in developed countries.

These very different circumstances across regions mean that the experiences of today's young people, as well as the implications of globalization for them, vary enormously. And even in countries in which the rate of economic growth has been very high, for some young people, particularly those in rural areas, the outward patterns and rhythms of life may appear to be largely unaffected.

Because of rapid population growth, young people who are poor are about as numerous today as they were in the past despite declining poverty rates; current estimates imply that roughly 325 million young people in developing countries are growing up on less than \$1 a day. Furthermore, the continuing growth in the absolute numbers of young people as well as the lengthening period of years spent unmarried (and in many cases sexually active) ensure a rapid and continuing growth in young peoples' need for education, as well as for reproductive and other health services. Further challenges include relatively poor learning outcomes in school among enrolled students and persistent disadvantages for young women, young people from low-income families, and young people living in the least developed countries.

Sub-Saharan Africa is a region of special concern. Not only are poverty rates rising and population growth rates proceeding at unprecedented levels, but also the risks of HIV/AIDS for young people are very high and increasing. Furthermore, recent data on school participation suggest that, in some settings during the 1990s, school attendance rates for boys fell as the prevalence of child labor rose. Growing pressures on school systems may further compromise school quality, which is already poor. While fewer African young people marry or bear children during adolescence relative to previous generations, many lack opportunities to use this lengthening adolescent phase of their lives to acquire needed education and training.

CRITERIA FOR SUCCESS

The panel's policy and program recommendations emerge from a conceptual framework that we developed to organize and guide this report. The framework identifies criteria for successful transitions in the context of contemporary global changes. We identified the importance of adequate preparation for five key adult roles: adult worker, citizen and community participant, spouse, parent, and household manager.

The defining attributes of such a conceptualization of successful transitions to adulthood, which must be seen within the constraints of personal endowments and capabilities, include at least the following:

- Good mental and physical health, including reproductive health, and the knowledge and means to sustain health during adulthood.

- An appropriate stock of human and social capital to be a productive adult member of society.
- The acquisition of prosocial values and the ability to contribute to the collective well-being as citizen and community participant.
- Adequate preparation for the assumption of adult social roles and obligations, including the roles of spouse or partner, parent, and household and family manager.
- The capability to make choices through the acquisition of a sense of self and a sense of personal competence.
- A sense of well-being.

While success is ultimately measured at the individual level, societies and their institutions at the international, national, and local levels, including governments of developed countries, can enhance successful transitions to adulthood. In the panel's view, policies that support universal primary schooling of adequate quality, that support the expansion of good secondary schooling, and that promote good health during this phase of the life cycle are essential in their own right but also important because of their role in promoting success in these other domains. In the panel's judgment, poverty is the greatest enemy of successful transitions.

PREPARATION FOR ADULT ROLES

Schooling

Young people in developing countries are spending more of their adolescence in school than ever before. Recent growth rates in all indicators of school participation and grade attainment have been substantial, historically unprecedented, and greater for girls than for boys. For example, on the basis of survey data representing 60 percent of the population of the developing world, mean grades attained have risen over the past 20 years from 6.0 to 7.4 (23 percent) for young men ages 20-24 on average and from 3.8 to 6.0 (58 percent) for young women ages 20-24. Furthermore, the percentage who have never attended school has fallen from 21 to 11 percent for boys ages 10-14 and from 39 to 18 percent for girls of the same age over the same period. These positive overall trends in schooling, while typical, are not universal.

Despite these trends, there remain large differences in school attendance rates according to wealth and residential status, with poor girls suffering particular disadvantage. Recent well-designed evaluation studies have shown that conditional grants or targeted subsidies can be effective strategies for increasing school attendance and progression rates among economically disadvantaged groups.

Global trends in population, health, urbanization, and education have all contributed positively to the growth in the demand for schooling. In most parts of the developing world today, young people live within reasonable proximity of a primary school—a notable achievement given the rapid growth in the school-age population. The results of recent internationally comparable standardized tests, however, raise serious concerns about how much students are actually learning in school—and therefore about school quality. Poor school quality and poverty remain major factors limiting enrollments, encouraging dropout, and compromising learning outcomes.

Health

The health of young people in developing countries is improving. Young people are entering the transition to adulthood healthier and with improved chances of surviving to old age. And continued reductions in mortality seem likely, with the major exception of countries strongly affected by the HIV/AIDS epidemic.

HIV/AIDS is now the leading cause of death among young people in sub-Saharan Africa. In other regions, it is among the least significant causes of death; instead, noncommunicable diseases predominate as well as injuries for men. Nevertheless, given the much higher mortality rates in sub-Saharan Africa than in the rest of the world, HIV/AIDS is now the leading cause of death for women ages 15-29 for the world as a whole and one of the leading causes of death for men in the same age group. Moreover, given the much larger population of young people in Asia, an increase in the epidemic there, which is projected by many, would mean that the numbers of young people affected would increase substantially.

Mortality and morbidity related to pregnancy and childbirth (particularly in sub-Saharan Africa and South Asia, where levels of early childbearing remain high) and as a direct consequence of unsafe abortion across all developing regions remain among the most significant risks to young women's health. Although young women appear less likely than older women to seek abortion, they are more likely to have the abortion later in the pregnancy and to choose an unsafe provider, thus putting them at greater risk.

Behaviors that young people adopt at this age have critical implications for their future health and mortality. In particular, unprotected sex is one of the riskiest behaviors that young people can undertake, particularly in settings in which HIV/AIDS is widespread. Evidence from Latin America and sub-Saharan Africa suggest that contraceptive use rates are increasing among sexually active young women, especially unmarried ones. Condom use, however, remains relatively low but is increasing rapidly in Latin America and the Caribbean as well as Eastern and Southern Africa. Poverty

and economic vulnerability enhance the likelihood that young people will engage in risky sexual behaviors. Furthermore, there is growing evidence that coercive sex is not an uncommon experience for many girls and young women.

However, sex is not being initiated at an earlier age relative to the past in most countries. While there has been an increase in the percentage having premarital sex before age 18 in many countries over the past 20 years, delays in the age of marriage in most countries have meant that, on balance relative to 20 years ago, fewer young women report themselves to have been sexually active before age 18. Thus while sex is being delayed, the context of first sexual experience is changing, with a greater likelihood now than in the past that first sex will be experienced prior to marriage.

Other adolescent behaviors with compromising long-term implications for health include smoking, drinking, and using illicit drugs. Across the developing world, tobacco use is increasing, and the gender gap in smoking prevalence is closing rapidly. There is also evidence that the prevalence of illicit drug use among young people is rising slowly. Alcohol intake is highest among affluent and urban young people and thus is also expected to increase with continued urbanization.

THE TRANSITION TO ADULT ROLES

The Transition to Work

The rise in school enrollment and the delay in the timing of school exit have resulted in a delay in the timing of labor force entry and a concomitant decline in the percentage of young people participating in the labor force, particularly at younger ages. Household poverty is strongly associated with the likelihood that children will participate in the labor force; thus a global decline in poverty is an important explanation for declines in the prevalence of labor market work among children. Rising poverty rates in sub-Saharan Africa imply a less positive outlook for trends in children's labor force participation, however.

The rise in school enrollment and attainment and the rapidly closing gender gap in schooling is leading to a growing equalization of work burdens between young men and women during their adolescent years. This is because students spend relatively little time in the labor market, and gender differences in mean daily hours spent by students in noneconomic household work (e.g., household chores) are relatively small. This equalization in work roles is further reinforced by the rise in the proportion of young women entering the labor force, in particular the paid labor force.

The economic returns to schooling at the secondary and tertiary levels

are consistently high (and differentially high for young women). The gap between the returns to higher and lower levels of schooling is widening, thus putting an increasing premium on secondary and tertiary schooling for later success in the labor market. It is not known the extent to which this shift in rates of return is due to globalization or other factors, such as declines in primary school quality resulting from rapid growth in the student population. Nevertheless, young people with secondary or tertiary schooling are increasingly advantaged in the labor market relative to their less educated peers not only in terms of earnings but also in terms of job stability and upward mobility.

In many parts of Asia, as well as in Latin America and the Caribbean, increased numbers of young people, including a rising percentage of young women, have been absorbed into the formal or informal labor market without any large increase in unemployment rates among young people. Indeed, some countries, particularly in Asia, have succeeded in maintaining strong economic growth at the same time that the labor force has been increasing rapidly, thus reaping an economic dividend as a result of these demographic shifts. However, youth unemployment is still a substantial challenge in some of the poorer countries of Asia, sub-Saharan Africa, and the Middle East, which continue to experience unprecedented growth in the size of their 10-24-year-old populations even though in many cases rates of population growth have now peaked.

The Transition to Citizenship

Globalization, trends toward greater democratization, rising school enrollment, and greater access to media have all increased opportunities for young people to engage in civic and political life. Recent survey data show that a majority of young men in many Latin American and Asian countries express an interest in politics and a willingness to engage in political activism, whereas young women appear somewhat less inclined to express these views. At the same time that young people are expressing greater voice at the local, national, and international levels, they are becoming increasingly aware of the growth of global diversity and inequality.

Various forms of participation in the life of the community, beyond political participation, are embraced in concepts of citizenship. A variety of institutions and programs, among them schools, employers, national service programs (including military service), sports, other nonformal programs, and the media are increasingly viewed as potentially important in citizenship formation. However, comparative data are lacking on the extent and nature of community participation among young people or on the roles that various institutions play in encouraging or discouraging participation.

The Transition to Marriage

While the transition into marriage is a key component of the transition to adulthood in most contexts, marriage, in and of itself, is not necessarily a marker of adulthood, particularly for the numerous young women who wed during the teenage years. Substantial delays in the timing of marriage among most young people, however, are contributing to an overall lengthening of the interval between childhood and the assumption of adult roles.

Compared with previous generations, a smaller proportion of young women and men are married in most regions. Men still marry at older ages than women. While only one-third of men in the developing world are married by ages 20-24, nearly two-thirds of women are married in this age group. Moreover, in certain regions, most notably the Middle East, a large fraction of men now postpone marriage until their 30s.

The minimum legal age of marriage for both men and women has risen in many countries in the past decade, and women are less likely to be married during the teenage years than in the past. However, child marriage, defined as marriage prior to age 18, is still widespread and viewed by many as a major violation of human rights. On the basis of survey data representing 60 percent of the population of the developing world, 38 percent of young women ages 20-24 married before age 18 (down from 52 percent 20 years ago), with the highest rates of child marriage currently occurring in Western and Middle Africa and South Asia. Young women who marry as minors are more likely to come from poor households and rural areas and to have relatively few, if any, years of schooling.

The age gap between spouses—often thought of as a measure of the degree of equality in marriage—appears to be narrowing, especially in sub-Saharan Africa and South Asia. There is also some evidence of growing agency on the part of young women with regard to choice of marriage partner, suggesting that the nature of marriage itself is changing.

The Transition to Parenthood

As in the past, entry into marriage is strongly associated with entry into parenthood. Over 90 percent of first births occur within marriage, and this percentage has changed only minimally over the past 20 years. With rising ages of marriage, the age of parenthood has been rising, but the gap between age at marriage and age at first birth has narrowed, falling from 22 to 16 months on average over the past 20 years. These postponements of marriage and parenthood allow young people more time to prepare for adult roles and provide an increasing number of young women with the opportunity to participate in the labor force prior to becoming a parent.

Rates of early childbearing remain high in many parts of the developing world because of high rates of early marriage, as noted above. Based on

survey data representing 60 percent of the population of the developing world, 23 percent of young people ages 20-24 gave birth before age 18 (down from 30 percent 20 years ago).

As a result of declines in early marriage, there has been a slight rise in the percentage of births to young women that are premarital. The level of premarital childbearing varies substantially across regions: from 14 percent having a premarital birth by the age of 20 in Eastern and Southern Africa to less than 1 percent in Asia and the Middle East. While Eastern and Southern Africa and Latin America and the Caribbean have seen recent small increases in the rates of premarital childbearing, the rates in other regions appear very low, but measurement is more difficult given continuing reluctance to interview unmarried women in Asia.

Although there is plentiful evidence that early childbearing is correlated with various negative outcomes, rigorous research confirming a causal role for age at birth in producing these outcomes does not exist. Major global changes, such as increasing school enrollment during late adolescence, rising rates of labor force participation among young women, and rising HIV/AIDS prevalence among young women in Africa, are likely to have important implications for the transition to parenthood, but little is known about the implications of these trends for first parenthood.

POLICY AND PROGRAM RECOMMENDATIONS

Policies and programs designed to achieve positive and sustainable development and combat poverty confront both the opportunity and the challenge of promoting successful transitions to adulthood for a steadily growing population of young people living in developing countries. Substantial investments in the health and schooling of young people, if designed and targeted effectively, will position these young people to participate constructively in shaping their own and their countries' futures.

The panel's policy and program recommendations were derived from a careful sifting of the empirical evidence. They address areas that are potentially encompassed by the scope of the United Nations (UN) Millennium Development Goals as well as others that are not within their current scope but are nonetheless of vital importance for young people. In the panel's view, policies and programs, if they are to be effective, will need to be evidence-based, appropriate to the local context, and developed in cooperation with developing country governments and local communities.

Poverty

The UN Millennium Development Goals, the international community's unprecedented agreement on targets toward the elimination of extreme

poverty, were not originally developed with a particular focus on young people. Nevertheless, the successful achievement by 2015 or beyond of many of these goals will require that policy makers center their attention on young people. Young people currently growing up in poverty face much greater health risks in both the short and longer term and are much less likely to attend schools of adequate quality, to complete primary school, to find secure and productive employment, to have opportunities for community participation, to marry well, or to be able to provide good care and support to their children.

Policies and programs designed to enhance successful transitions for young people, whether they are reproductive health programs, programs to enhance school quality or reduce dropout rates, job training programs, livelihood or civic education programs, or programs for first-time parents—should be targeted to the poor, particularly poor young women, who are often doubly disadvantaged. Evaluation research shows that important actors in the system—parents, students, teachers, employers, and administrators—can be very responsive to well-designed incentive programs.

Schooling

At their best, schools have the capacity to enhance success in all transitions to adulthood through the acquisition of literacy in a commonly spoken language and the transmission of knowledge and means to sustain health, prosocial values and citizenship knowledge and skills, decision-making, negotiating, and leadership skills and skills for lifelong learning. While the panel supports the UN Millennium Development Goals for education, it does not see the achievement of these goals—universal primary school completion rates and the elimination of gender disparities at all levels of schooling—as sufficient for the next generation of young people to acquire the skills necessary for successful transitions to adulthood. The rapidity of global change and changing patterns of employment require that policy makers give equal attention to investments in school quality in order to ensure adequate learning outcomes at the primary level as well as to create a stronger base for further expansions in enrollment at the secondary level. The panel also identified carefully targeted subsidies as a particularly promising way to increase enrollment and reduce the prevalence of child labor among the poor.

Declines in fertility and improvements in child health have been shown to have contributed to past increases in the demand for schooling. Policies and programs supporting further progress in these areas are likely to continue to contribute to future growth in school enrollment and attainment.

Gender Equality and the Empowerment of Women

Throughout its report, the panel documents systematic gender differences in pathways to adulthood as well as the universal persistence of dual social norms relating to the sexual behavior of young people. The panel's recommendations on gender equality emphasize the promotion of equitable treatment in the classroom through gender training for teachers and school administrators, the development of compensatory educational and training programs for disadvantaged and out of school youth, particularly girls, and the adoption of policies and programs that support delays in marriage in places where girls still marry before age 18. Addressing gender problems in society will call for interventions that affect all social classes and that give as much attention to boys' attitudes and behaviors as to girls'.

Health, Particularly Reproductive Health

In developing recommendations, the panel focused on policies and programs for young people in the area of sexual and reproductive health as specified in the panel's original charge. We also documented the emergence of other areas of health and health behaviors that need policy and program attention, including mental health and health compromising behaviors such as smoking. The panel identified maternal mortality as one of the major causes of death and morbidity for young women in all developing regions except Eastern Asia and HIV/AIDS as the major cause of death and morbidity for young people in sub-Saharan Africa.

The provision of information and services for young people, married and unmarried, in the area of sexual and reproductive health is generally limited to small-scale efforts that reach a fraction of the population of young people. The panel recommends that policy makers give priority to increasing the provision of general health information and sex education, including negotiating skills, in school and out of school for all young people and to increasing the availability of services for those who are sexually active. No single approach is likely to serve the needs of all young people, however, given their diversity of life circumstances.

In the view of the panel, programs designed to reduce risky and unprotected sex among young people are critical to successful transitions and will require multipronged and multisectoral approaches that are culturally appropriate, community based, and sensitive to the needs and preferences of young people, including active collaboration between the health and education sectors. Indeed, some of the most important reproductive health interventions for young people may lie outside the health sector. For example, school participation and attainment appear to have important and mostly

positive associations with young people's health; both male and female students who remain enrolled during their teens are substantially less likely to have had sex than their unmarried nonenrolled peers. Thus resources spent on expanding opportunities for secondary schooling may have a direct impact on the reproductive health of both young men and women.

Youth Employment

Policies and programs with implications for young people's successful transition to work in developing countries exist at all levels of action. However, regulations that are commonly enacted in developing countries for the purpose of improving the terms and conditions of employment put young people at a disadvantage in competing for jobs in the formal labor market and encourage the growth of an informal, unregulated sector. Young people are likely to fare better in a labor market in which employers do not face excessive regulation or in which government incentives encourage firms to invest in training.

The panel has also noted that too often policies affecting aid and trade are not coordinated. For example, trade sanctions against products produced with child labor or against countries known to violate international labor standards relating to child labor are likely to do more harm than good in contexts in which poverty is persistent and the family economy still relies on child labor. While the focus of this report has been on policies and programs directly targeted to young people, the panel notes that agricultural and trade policies aimed at reducing nonmarket imperfections in the terms of trade between developed and developing countries could potentially be a far more effective means of helping the world's poor.

KNOWLEDGE GAPS AND DIRECTIONS FOR FUTURE RESEARCH

Much more is known about basic patterns and trends than about the determinants or the consequences of these trends or about the extensive variability among young people in developing countries. Gaps in knowledge that emerge from the juxtaposition of our conceptual framework and our compilation of solid evidence form the basis of research questions that are provided at the end of each chapter. From these, many additional cross-cutting questions emerge. From the very rich experience of researchers in industrialized countries, we have learned how much there is to be gained from building multidisciplinary research teams, following cohorts over prolonged periods of time, and measuring a full range of social, psychological, health, and economic outcomes while deploying a mix of research methods.

In the final chapter, we recommend specific ways that existing data

collection and compilation operations can be enhanced, identify promising quantitative and qualitative research approaches (not always new but underutilized) that would significantly deepen understanding of transitions to adulthood and suggest how findings from research and program and policy evaluation can be more effectively integrated into innovative and large-scale interventions. In particular, the panel recommends that evaluation should be adopted as an integral part of policy and program innovation for all interventions designed to enhance successful transitions to adulthood.

THE NATIONAL ACADEMIES

Advisers to the Nation on Science, Engineering, and Medicine

The **National Academy of Sciences** is a private, nonprofit, self-perpetuating society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. Upon the authority of the charter granted to it by the Congress in 1863, the Academy has a mandate that requires it to advise the federal government on scientific and technical matters. Dr. Bruce M. Alberts is president of the National Academy of Sciences.

The **National Academy of Engineering** was established in 1964, under the charter of the National Academy of Sciences, as a parallel organization of outstanding engineers. It is autonomous in its administration and in the selection of its members, sharing with the National Academy of Sciences the responsibility for advising the federal government. The National Academy of Engineering also sponsors engineering programs aimed at meeting national needs, encourages education and research, and recognizes the superior achievements of engineers. Dr. Wm. A. Wulf is president of the National Academy of Engineering.

The **Institute of Medicine** was established in 1970 by the National Academy of Sciences to secure the services of eminent members of appropriate professions in the examination of policy matters pertaining to the health of the public. The Institute acts under the responsibility given to the National Academy of Sciences by its congressional charter to be an adviser to the federal government and, upon its own initiative, to identify issues of medical care, research, and education. Dr. Harvey V. Fineberg is president of the Institute of Medicine.

The **National Research Council** was organized by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and advising the federal government. Functioning in accordance with general policies determined by the Academy, the Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in providing services to the government, the public, and the scientific and engineering communities. The Council is administered jointly by both Academies and the Institute of Medicine. Dr. Bruce M. Alberts and Dr. Wm. A. Wulf are chair and vice chair, respectively, of the National Research Council.

Preface

As chair of the Panel on Transitions to Adulthood in Developing Countries, I would like to say on behalf of the panel that we have been privileged and challenged by our task of examining the changing lives of young people in developing countries at the beginning of the twenty-first century. *Growing Up Global: The Changing Transitions to Adulthood in Developing Countries* is the product of a three-year effort during which time the panel reviewed many different literatures and conducted much new data analysis.

Throughout the project, the panel was committed to focusing on the links and interconnections between the productive and reproductive domains of young peoples' lives that have typically been treated in isolation from each other. It is our hope that this approach will inspire a next generation of researchers and policy makers to see the different aspects of young peoples' lives in a more interconnected way, allowing new insights for policies and programs.

This report would not have been possible without the help of numerous people and organizations. First, we wish to thank the report's sponsors: the U.S. Agency for International Development, the David and Lucille Packard Foundation, The Andrew W. Mellon Foundation, the William and Flora Hewlett Foundation, the World Bank, and the John D. and Catherine T. MacArthur Foundation.

This report reflects the intense deliberations of the panel (see Appendix C for biographical sketches) who met multiple times over the course of the project. At an early stage of the project, I formed working groups to take up certain cross-cutting topics in support of the panel's work. These met either in person or by conference call and built on the expertise of various panel

members. With the formation of these groups, panel members were able to get fully engaged in the work of the panel in order to ensure their collective input at an early stage of the project. The first group, the theory group, held two meetings, one hosted by Richard Jessor at the University of Colorado. This group included Kuate Defo, Nan Astone, Nelly Stromquist, Richard Jessor, Jere Behrman, Anastasia Gage, Kaushik Basu, Cynthia Lloyd, and Valerie Durrant. A data group was formed to assess the availability of census and survey data from two recent points in time to undertake analyses of the interrelationships between various role transitions. The data group included David Lam, Jere Behrman, Susheela Singh, Cynthia Lloyd, and Valerie Durrant. A program evaluation group was formed to set standards of evidence for the evaluation of programs; this group included Robert Magnani, Robert Blum, Jere Behrman, Carlos Aramburú, Nelly Stromquist, Kuate Defo, Cynthia Lloyd, and Valerie Durrant. Finally, a reproductive health working group consisted of Barbara Mensch, Anastasia Gage, Robert Blum, Carlos Aramburú, Shireen Jejeebhoy, Susheela Singh, Valerie Durrant, and Cynthia Lloyd.

The panel also commissioned papers by panel members and other experts to provide background information on which the panel report could build. These papers helped fill some of the knowledge gaps and thus provided useful analyses, all of which are cited and some of which are incorporated into the panel report. But a number of these background studies, in addition to providing inputs for the panel report, constitute useful contributions to the knowledge of transitions to adulthood in developing countries that are richer and broader than what is incorporated into the report itself. The panel therefore established an editorial committee for these papers composed of Jere Behrman, Barney Cohen, Cynthia Lloyd, and Nelly Stromquist. They took responsibility for reviewing the papers directly and oversaw a process of external review and revision according to National Research Council (NRC) procedures. The table of contents for this edited volume titled, *The Changing Transitions to Adulthood in Developing Countries: Selected Studies* (editors, Cynthia B. Lloyd, Jere R. Behrman, Nelly P. Stromquist, and Barney Cohen) appears in Appendix B of this report.

After five meetings of the full panel, I appointed an editorial committee, with the support of the full panel, to carry forward the preparation of draft chapters on behalf of the panel, and this group of panel members spent significant time in the last year of the project attending two additional meetings and sharing the responsibility for the final preparation of the manuscript. Members of the editorial committee were: Nelly Stromquist, Nan Astone, Jere Behrman, David Lam, Barbara Mensch, Richard Jessor, and Cynthia Lloyd. I then took primary responsibility, with the support of Barney Cohen, for the final revision and editing of the manuscript in preparation for review.

Consequently, this report is truly the collective product of panel members and staff. Its content reflects the deliberations of the full panel who reviewed and revised all contributions. The purpose of the following list, therefore, is to give credit to individuals but not to assign final responsibility for the published text.

Executive Summary: This is the collective product of the deliberations of the entire panel

Chapter 1: C. Lloyd and R. Jessor

Chapter 2: B. Cohen, R. Jessor, H. Reed, C. Lloyd, J. Behrman, and D. Lam

Chapter 3: C. Lloyd, D. Lam, J. Behrman, and N. Stromquist

Chapter 4: A. Blanc, R. Magnani, S. Singh, S. Jejeebhoy, and R. Bulatao

Chapter 5: C. Lloyd, D. Lam, and J. Behrman

Chapter 6: M. Grant, N. Varia, V. Durrant, and N. Stromquist

Chapter 7: B. Mensch

Chapter 8: C. Lloyd, S. Singh, N. Astone, B. Mensch, and S. Jejeebhoy

Chapter 9: C. Lloyd

Appendix A: C. Lloyd and V. Durrant

It should be noted that the authors listed for each chapter include those who took up major writing responsibilities at various stages of each chapter's preparation. The first author listed is the person who took the major responsibility for putting the chapter into final shape for review. These chapters occasionally contain additional paragraphs from other hands.

I want to single out for special mention the panel members who served as members of the editorial committee because of their continuing involvement in the work of the panel report from beginning to end as well as in the preparation of the accompanying volume of papers. Their involvement went well beyond what could be fully reflected in the chapter authorship list above. As chair, I want to thank each of them individually for their contributions as well as for their strong support and steady partnership throughout the volume.

Richard Jessor served as the panel's theoretician and conscience. He challenged us to develop a conceptual framework that would outlive the temporal nature of our material, provided all of us with lots of good humor along the way, and provided me most importantly with a helpful sounding board throughout the project. He also collaborated on the drafting of Chapters 1 and 2.

Jere Behrman was a constructive partner and critic at each stage of the drafting of two of the longest and most challenging chapters—3 and 5. In

addition, he wrote several commissioned papers in order to strengthen the panel's treatment of policy and program evaluation throughout the volume as well as of issues of global convergence and divergence covered in Chapter 2. He also served as a coeditor of the volume of papers.

Nelly Stromquist brought a critical perspective to our work from an intellectual tradition that lay outside the tradition common to many panel members. She provided patient, persistent, and constructive input to the work of the panel throughout the life of the project. This included collaborating on the drafting of Chapters 3 and 6 and serving as coeditor of the volume of papers.

David Lam was a strong supporter of the project from its inception as a member of the NRC's Committee on Population and undertook substantial new data analysis with census and survey data to explore the interrelationships between various transitions to adulthood. He also collaborated on the drafting of Chapters 3 and 5.

Nan Astone brought her experience and expertise in the study of adolescents in the United States to our panel discussions, thus helping to shape our conceptual approach and our comparative perspective. She also played a major role in the drafting of Chapter 8 on parenthood.

Barbara Mensch, who works next door to me at the Population Council, not only became the sole author of Chapter 7 on marriage but also provided me with a steady dose of solidarity, comradeship, and advice throughout the project.

Several other individuals made key contributions that deserve special mention. Susheela Singh, Shireen Jejeebhoy, and Robert Magnani, members of the panel but not members of the editorial committee, took up drafting roles for Chapters 4 and 8. Amanda Ritchie, as a consultant to NRC, was our resident anthropologist. She wrote all of the boxes in Chapters 4, 7, and 8 and some others scattered throughout the volume, took the lead on the comparative analysis of time use data that is featured in Chapter 5, and undertook substantial background research for Chapter 4. Monica Grant, research coordinator in the Policy Research Division of the Population Council, in addition to being a lead author on Chapter 6, was responsible for most of the data analysis for Chapters 4, 7, and 8. Her speed and agility at programming 50 data sets simultaneously was truly extraordinary and was also complemented by her good understanding of the material and her many good ideas about how to handle the data. Barbara Miller, my staff assistant at the Population Council, has been my right hand throughout the project. She set up the original files to handle all the weighted regional averages for the analysis of Demographic and Health Surveys (DHS) data and undertook endless revisions and updates with good cheer. She was also responsible for handling all the references for Chapters 3, 5, 7, and 8. Paul Hewett, my collaborator on the paper on primary schooling in

Africa, took responsibility for the original data analysis for Chapter 3 and provided technical support and advice throughout the project. Holly Reed at the NRC prepared a preliminary draft of Chapter 2 as did Jonathan Zaff, a consultant, for Chapter 5. Ann Blanc and Randy Bulatao served as consultants for Chapter 3 and Nisha Varia for Chapter 6. Richard Anker provided advice on Chapter 5 at an informal meeting of interested panel members scheduled when he was on this side of the Atlantic, and Ron Kassimir of the Social Science Research Council and Martin Riesebrodt of the University of Chicago provided valuable advice and literature reviews on religion that served as background material for Chapter 2. Others who assisted in the analysis of data or who provided us with access to data include Sara Zellner, Suhaila Khan, Erin Murphy-Graham, Georgeann Higgins, Rubina Hussain, Christine Schippers, Claudia Stilman, Djavad Salehi, Matthew Sobek, Anil Deolalikar, Jed Friedman, and Lupin Rahman.

Several experts participated in a planning meeting in January 2001 to help formulate a plan for the panel's contributions. We acknowledge the collective contribution of the following members of the planning group who are not members of the panel: Richard Anker, Julie DaVanzo, Bessie Lee, Marlane Lockheed, Anju Malhotra, Karen Mason, Susan Newcomer, Agnes Quisumbing, and Peter Xenos.

The panel was fortunate to hold one of its meetings in Mexico City, which was hosted by Consejo Nacional de Población (CONAPO) in February 2002, and would like to thank Rodolfo Turian, Elena Zuniga, and Cristina Gil Villegas for their help in making the meeting possible. During the visit, the panel received a special briefing on Programa de Educación, Salud y Alimentación (PROGRESA) from Santiago Levy and heard presentations from several researchers at the Colegio de México—Claudia Stern, Rosa Maria Camareno, and Carlos Echarri—who had undertaken research on transitions to adulthood among Mexican adolescents. The panel also met with youth from Gente Joven and Balance, a young women's network in Mexico City promoting citizenship rights and political participation. Virginia Rodriguez coordinated the visit to Gente Joven. Staff from Balance included Maria Antonieta Alcalde Castro, Esteban Inzua, Belén Gutierrez, Nancy Olguin, and Mariana Pérez Ramirex.

The panel also cosponsored an expert meeting with the World Bank on Assessing the Economic Benefits of Investments in Youth in collaboration with Elizabeth Lule and Jim Rosen. Papers were presented by Jere Behrman, Jim Knowles, Wendy Cunningham, Paolo Belli, and Olivier Appaix. Others who attended the meeting and provided valuable discussion include: Robert Holzmann, Jane Ross, Maureen Lewis, Mayra Buvinic, Jacques van der Gaag, Alex Preker, Nancy Williamson, Christine Norton, Matilde Maddaleno, Laura Laski, and Aleksandra Posarac.

Many other colleagues supplied the panel with research in the form of

background papers. The panel benefited greatly from these papers and thanks the following individuals for their contribution: Patrick Emerson, André Portela Souza, Shireen Jejeebhoy, Shiva Halli, Agnes Quisumbing, Kelly Hallman, Emily Hannum, Jihong Liu, Piyali Sengupta, Jere Behrman, Jim Knowles, David Lam, Leticia Marteleto, Sajeda Amin, Cynthia Lloyd, Paul Hewett, Monica Grant, Barbara Mensch, Susheela Singh, John Casterline, Peter Xenos, Sulistinah Achmad, Hui Sheng Lin, Ping Keung Luis, Chai Podhisita, Corazon Raymundo, Shyam Thapa, Nan Astone, Ken Hill, Margaret Wedon, Barthelemy Kuate Defo, Robert Blum, and Kristin Nelson-Mmari.

No project of this magnitude could be undertaken without able staff. Valerie Durrant was staff director for our panel at the NRC from the panel's inception in early 2001 until September 2003, initially as a fellow of the University of Michigan Population Fellows Program and later as a regular NRC employee. She did an excellent job of coordinating the work of the panel, arranging meetings of the panel and its various working groups, arranging for literature reviews and data analyses, working closely with our sponsors, co-organizing the expert group meeting on Assessing the Economic Benefits of Investment in Youth (October 15, 2002) in collaboration with the World Bank, and most particularly supporting me in my role as chair. She also did some major background research for Chapter 3 and did some data analysis and rewrote parts of Chapter 6. Her enthusiasm for the subject was infectious and she had a full mastery of the panel's scope. She was sorely missed after her departure, which came at the time the project had originally been scheduled for completion. Barney Cohen, director of the Committee on Population, oversaw the work and managed the final stages of the process, including the response to review. The panel owes a huge debt to both Valerie Durrant and Barney Cohen, and we are deeply grateful for their support throughout the project.

In addition, special thanks are due to Christine Covington-Chen for her superb administrative and logistic support, to Christine McShane for skillfully editing the manuscript, to Kirsten Sampson Snyder for navigating the report through review, to Anthony Mann for preparing the final manuscript, and Yvonne Wise for steering the manuscript through the production process.

This report has been reviewed in draft form by individuals chosen for their diverse perspectives and technical expertise, in accordance with procedures approved by the NRC's Report Review Committee. The purpose of this independent review is to provide candid and critical comments that will assist the institution in making its published report as sound as possible and to ensure that the report meets institutional standards for objectivity, evidence, and responsiveness to the study charge. The review comments and

draft manuscript remain confidential to protect the integrity of the deliberative process. We thank the following individuals for their review of this report: Jeffrey Jensen Arnett, *Journal of Adolescent Research*, University Park, MD; Suzanne Duryea, Research Department, Inter-American Development Bank, Washington, DC; Constance A. Flanagan, Agricultural Sciences, Pennsylvania State University; Stephen F. Hamilton, Family Life Development Center, Cornell University; John Hobcraft, Department of Social Policy and Demography, University of York, United Kingdom; Reed Larson, Department of Human and Community, University of Illinois, Urbana, IL; Thomas LeGrand, Demography Department, University of Montreal, Canada; Anju Malhotra, Population and Social Transitions, International Center for Research on Women, Washington, DC.

Although the reviewers listed have provided many constructive comments and suggestions, they were not asked to endorse the conclusions and recommendations nor did they see the final draft of the report before its release. The review of this report was overseen by Marshall S. Smith, Education Program, The William and Flora Hewlett Foundation. Appointed by the NRC, he was responsible for making certain that an independent examination of this report was carried out in accordance with institutional procedures and that all review comments were carefully considered. Responsibility for the final content of this report rests entirely with the authoring committee and the institution.

Finally, I owe a special debt of gratitude to the Population Council, where I work, which has stood behind me during the three years of the project and supported my time on the project. The Population Council has made a substantial commitment to research on transitions to adulthood over the past eight years, thanks to generous funding from the U.K. Department for International Development, the Rockefeller Foundation, the Andrew W. Mellon Foundation, the William and Flora Hewlett Foundation, the U.S. Agency for International Development, and the Spencer Foundation, among others. Many colleagues of mine at the Population Council have shared in this collective effort, and I owe them all a debt of gratitude. They include, but are by no means limited to, Sajeda Amin, Martha Brady, Judith Bruce, Judy Diers, Anabel Erulkar, Nicole Haberland, Kelly Hallman, Paul Hewett, Barbara Ibrahim, Shireen Jejeebhoy, Barbara Mensch, Mark Montgomery, Zeba Sathar, and Minhaj ul Haque. John Bongaarts, vice president of the Population Council in charge of the Policy Research Division, has also been an enthusiastic supporter and a patient listener through the project, and it is his support most of all that has allowed me the time and space to embark on this major undertaking and follow it through until its very end.

For me it has been an honor and a privilege to serve as chair of this

panel. I have met and become friends and colleagues with so many people I otherwise would not have known and have learned so much in the process. The product is truly a collective one, enriched and strengthened by the passions, ideas, knowledge, talents, and good humor of all my fellow panel members. To them all, I am most deeply grateful.

Cynthia B. Lloyd, *Chair*
Panel on Transitions to Adulthood in
Developing Countries
